Project 1: Portfolio Performance & Risk Dashboard

Table 1: Portfolio Risk Summary for Selected Equities

Ticker	Annualized Return	Annualized Volatility	Sharpe Ratio	Max Drawdown
XOM	0.2740	0.2666	0.8779	-0.2051
JPM	0.1976	0.2435	0.6471	-0.3877
SPY	0.1362	0.1709	0.5631	-0.2450
AAPL	0.1885	0.2749	0.5402	-0.3336
JNJ	0.1110	0.1673	0.4243	-0.1841
MSFT	0.1378	0.2643	0.3698	-0.3715

Figure 1: 5-Year Performance of Selected Equities

Figure 2: 5-Year Drawdowns of Selected Equities

Figure 3: Correlation Matrix of Selected Equities

Key Findings:

- ExxonMobil (XOM) served as the portfolio's primary performance driver, delivering substantial excess return over the SPY benchmark. With an annualized return of 27.37% and a sector-leading Sharpe Ratio of 0.8766, the asset effectively compensated for its inherent cyclical volatility, proving highly accretive to the portfolio's overall risk-adjusted yield.
- Johnson & Johnson (JNJ) functioned as the critical defensive anchor during the evaluated horizon. Exhibiting the lowest annualized volatility (16.73%) and the shallowest maximum drawdown (-18.41%), it provided necessary portfolio stabilization and capital preservation during broader market selloffs.
- While individual mega-cap tech equities (AAPL, MSFT) are traditional growth engines, they introduced significant drag on the portfolio's risk profile. Both assets experienced severe drawdowns (exceeding -33%) and elevated volatility, resulting in Sharpe ratios that trailed the broader SPY benchmark (0.5631). This underscores the risk of over-concentration in high-beta sectors without adequate diversification.

Project 2: ETF/Sector Comparison Analysis

Table 1: ETF Comparison Summary

Ticker	Annualized Return	Annualized Volatility	Sharpe Ratio	Max Drawdown
XLK	0.2025	0.2479	0.6554	-0.3356
QQQ	0.1661	0.2242	0.5625	-0.3512
SPY	0.1360	0.1709	0.5621	-0.2450
XLF	0.1075	0.1867	0.3616	-0.2581

Figure 1: Comparison of ETF Risk and Return Metrics

Figure 2: 5-Year Drawdowns of Selected ETFs

Key Findings:

- The technology sector (XLK) generated the highest risk-adjusted returns over the evaluated period, boasting a Sharpe Ratio of 0.6554 and an annualized return of 20.25%, significantly outperforming the broader market benchmark.
- This outperformance required absorbing severe downside exposure. Tech-heavy funds bore the brunt of market turbulence; XLK proved to be the most volatile asset overall (24.79% annualized volatility), while QQQ suffered the deepest maximum drawdown of -35.12% during market corrections.
- In contrast to the high-beta tech funds, the broader benchmark (SPY) and Financials (XLF) exhibited much shallower drawdowns (-24.50% and -25.81%, respectively), demonstrating better capital preservation and stabilization during aggressive market selloffs.
